Fundamentally a good layout should attract attention and interest and should provide some control over the manner in which the advertisement is read. The message to be communicated may be sincere, relevant, and important to the consumer, but because of the competitive “noise” in the communication channel, the opportunity to be heard may depend on the effectiveness of the layout. In addition to attracting attention, the most important requisites for an effective layout are balance, proportion, movement, unity, clarity and simplicity, and emphasis.

**Balance**

Balance is a fundamental law in nature and its application to layout design formulates one of the basic principles of this process. Balance

is a matter of weight distribution; in layout it is known as the optical center of an advertisement, the point which the reader's eye designates as the center of an area. In an advertisement a vertical line which divides the area into right and left halves contains the center; however the optical center is between one-tenth and one-third the distance above the mathematical horizontal center line...

In order to provide good artistic composition, the elements in the layout must be in equilibrium. Equilibrium can be achieved through balance, and this process may be likened to the balancing of a seesaw. The optical center of the advertisement serves as the fulcrum or balancing point, and the elements may be balanced on both sides of this fulcrum through considerations of their size and tonal quality.

The simplest way to ensure formal balance between the elements to the right and left of the vertical line is to have all masses in the left duplicated on the right in size, weight, and distance from the center... Formal balance imparts feelings of dignity, solidity, refinement, and reserve. It has been used for institutional advertising and suggests conservatism on the part of the advertiser. Its major deficiency is that it may present a static and somewhat unexciting appearance; however, formal balance presents material in an easy-to-follow order and works well for many ads.

To understand informal balance, think of children of unequal weight balanced on a seesaw; to ensure equilibrium it is necessary to place the smaller child far from the center and the larger child closer to the fulcrum. In informal balance the elements are balanced, but not evenly, because of different sizes and color contrast. This type of an asymmetric balance requires care so that the various elements do not create a lopsided or top-heavy appearance. A knowledge or a sense of the composition can help create the feeling of symmetry in what is essentially asymmetric balance.

Informal balance presents a fresh, untraditional approach. It creates excitement, a sense of originality, forcefulness, and, to some extent, the element of surprise. Whereas formal balance may depend on the high interest value of the illustration to attract the reader, informal balance may attract attention through the design of the layout....

Proportion

Proportion helps develop order and creates a pleasing impression. It is related to balance but is concerned primarily with the division of the space and the emphasis to be accorded each element. Proportion, to the advertising designer, is the relationship between the size of one element in the ad to another, the amount of space between elements, as well as the width of the total ad to its depth. Proportion also involves the tone of the ad: the amount of light area in relation to dark area and the amount of color and noncolor.

As a general rule unequal dimensions and distances make the most lively design in advertising. The designer also places the elements on the page so that each element is given space and position in proportion to its importance in the total advertisement and does not look like it stands alone.

Movement

If an advertisement is to appear dynamic rather than static, it must contain some movement. Movement (also called sequence) provides the directional flow for the advertisement, gives it its follow-through, and provides coherence. It guides the reader's eye from one element to another and makes sure he or she does not miss anything.

Motion in layout is generally from left to right and from top to bottom—the direction established through the reading habits of speakers of Western language. The directional impetus should not disturb the natural visual flow but should favor the elements to be stressed, while care should be taken not to direct the reader's eye out of the advertisement. This can be done by the following:

- **Gaze motion** directs the reader's attention by directing the looks of the people or animals in an ad. If a subject is gazing at a unit in the layout, the natural tendency is for the reader to follow the direction of that gaze; if someone is looking directly out of the advertisement, the reader may stop to see who's staring.
- **Structural motion** incorporates the lines of direction and patterns of movement by mechanical means. An obvious way is to use an arrow or a pointed finger....

Unity

Another important design principle is the unification of the layout. Although an advertisement is made up of many elements, all of these should be welded into a compact composition. Unity is achieved
when the elements tie into one another by using the same basic shapes, sizes, textures, colors, and mood. In addition, the type should have the same character as the art.

A border surrounding an ad provides a method of achieving unity. Sets of borders may occur within an ad, and, when they are similar in thickness and tone, they provide a sense of unity.

Effective use of white space can help to establish unity. . . . White space is defined as that part of the advertising space which is not occupied by any other elements; in this definition, white space is not always white in color. White space may be used to feature an important element by setting it off, or to imply luxury and prestige by preventing a crowded appearance. It may be used to direct and control the reader's attention by tying elements together. If white space is used incorrectly, it may cause separation of the elements and create difficulty in viewing the advertisement as a whole.

Clarity and Simplicity

The good art director does not permit a layout to become too complicated or tricky. An advertisement should retain its clarity and be easy to read and easy to understand. The reader tends to see the total image of an advertisement; thus it should not appear fussy, contrived, or confusing. Color contrasts, including tones of gray, should be strong enough to be easily deciphered, and the various units should be clear and easy to understand. Type size and design should be selected for ease of reading, and lines of type should be a comfortable reading length. Too many units in an advertisement are distracting; therefore, any elements that can be eliminated without destroying the message should be. One way in which clarity can be achieved is by combining the logo, trademark, tag line, and company name into one compact group.

Emphasis

Although varying degrees of emphasis may be given to different elements, one unit should dominate. It is the designer's responsibility to determine how much emphasis is necessary, as well as how it is to be achieved. The important element may be placed in the optical center or removed from the clutter of other elements. Emphasis may also be achieved by contrasts in size, shape, and color, or the use of white space.

Questions on Meaning

1. In one sentence per the following terms, define balance, proportion, movement, unity, clarity, simplicity, and emphasis.
2. What is the difference between formal and informal balance?
3. What is the significance of movement to effective graphic design? How can unity be achieved?

Questions on Rhetorical Strategy and Style

1. This selection is written in typical textbook style. How would you characterize it?
2. What information does the author supply to help the reader understand these elements? What might the author have included that she did not, in your opinion?
3. What visual cues helped your reading of this selection?

Writing Assignments

1. Test your understanding of these terms by choosing an ad and analyzing it accordingly. Which elements were you able to apply most readily? Which proved most difficult?
2. Explain in an essay what the author means by balance. How is balance "a fundamental law in nature"? In your essay, detail examples of where this concept appears to hold true.
